If I've got a camera that is still in warranty, how can I tell if it's going to die soon? I've had similar issues with several cameras in the past. Either they have been misused so much they don't work (no power, no charge, etc.), or the internal sensor has been used enough times that it just won't work anymore (bright spots, streaks, etc.). What's the best way to

check a camera's sensor so that I know when to replace it? A: I don't know if this is true of all cameras but usually cameras will have an input for a battery or other power supply. For example, I have a Nikon D70 which has a small AC adapter attached on the rear of the camera. If you remove this power supply, the camera will probably still work but if the power supply is removed for more than a week the internal sensor will get weak. Also, using the internal sensor too much will cause a similar problem. There is a risk that the sensor could get so weak that even when the battery is recharged it won't work again. But if your camera does not have a battery/AC adapter on it, this is probably not true. One thing you can try is simply to disconnect the power from the camera. It will turn off and allow you to inspect the sensor, but it is still possible for the sensor to become weak. So, even though the camera is not charging the battery 1d6a3396d6
