Extensibility also involves allowing third-party software developers to add their own components, tools and automation to AutoCAD. Since the format of all drawing files is standardized (DXF), this is an open-architecture. Third-party developers can freely use the official API (Application Programming Interface), such as Visual LISP, VBA, .NET, and ObjectARX, to extend AutoCAD to add capabilities specific to their field of activity. Programming interfaces AutoCAD supports the following APIs for customizations and automation: Visual LISP: AutoCAD's native programming language, which allows customized extensions of core AutoCAD functionality. VBA: Microsoft's proprietary programming language that is based on Visual LISP and is compatible with all Microsoft Office applications. .NET: A programming language based on Java that allows adding customizability to AutoCAD via plug-ins developed using .NET. ObjectARX: A C++ class library that provides programmers with a powerful framework for creating custom applications, the ObjectARX library is used to create all CAD plugins for AutoCAD. Visual LISP Visual LISP is a proprietary AutoCAD extension language, which runs on both Mac and Windows and is based on Visual Basic. AutoCAD's native programming language is Visual

LISP, which allows customized extensions of core AutoCAD functionality. In Visual LISP, programmers create extensions called "macros" and then store them in a file called "macro.lsp" for easy reference. The macros are then activated in AutoCAD via the Customize user interface. Visual LISP is released as an add-on product for Autodesk-licensed AutoCAD. Then create a template as mentioned in the download below Autocad Save the template as a *.dwg file on your computer. Open the template you just downloaded. In the upper right corner press the button "Place" then press "Import" Click on "Autocad" Select the file you just saved in step 3. Click on "Insert" and then on "Import" Select the model you just exported in step 1. Click on "Insert" and then on "Place". Press "Close" Your model is now placed and it will be rotated based on the rotation you chose. Select all the elements you want to export and click on "Export" On the Export dialog, select the options for exporting. The default is "CAD" so the file you just saved is now a *.dwg. Check the Save/add to shortcut menu. Select "Add to dashboard". You'll now have an icon next to the word "To do" on the toolbar. Click on it. A small box will open on the right side of your screen. Click on "Import" Navigate to your model. Select the model. Click on "Open" and then on "Import". You're done. Now open the *.dwg file you just created. Select everything you want to be in the model (I used the "Rotate, Scale, Skew and Mirror"). The element should be automatically placed in the drawing. Change its scale and click on "Set as active". Click on "Finish". It's now set as active. Make sure the scaling is correct. Ok... the keygen is done Here is a download link with the template for AutoCAD 2016. * I also used Autodesk softimage for a first draft. You can download it from Autodesk Softimage website This is what you should see That's all. You're done. Hope it helped. Good luck.
