The present invention generally relates to x-ray detectors and radiographic systems that record images by the use of a radiation image sensor. More specifically, this invention is directed to an x-ray detector with parallel driving circuits in which analog detection signals generated from a charge-coupled device (CCD) are read out by a driving circuit for each pixel, and a radiographic system that is equipped with the x-ray detector. The x-ray detector is configured such that multiple linear driving circuits drive multiple pixels arranged in a matrix within the x-ray detector so that the entire charge stored in each pixel in response to an image is read out at the same time. The analog detection signals from the multiple pixels are then read out by a reading circuit. The reading circuit is provided with a differential amplifier, for example. In this way, the analog detection signals read out by the multiple driving circuits are output in parallel from the x-ray detector. The radiographic system that is equipped with such x-ray detectors is provided with a detector controller that controls the x-ray detector. The detector controller distributes data to be processed to the driving circuits for the pixels. Hitherto, in an x-ray radiographic system, an x-ray image of a subject such as a human body is generated based on attenuation of the x-rays transmitted through the subject. To enable a good image to be generated, the x-rays radiated from an x-ray source (hereinafter referred to as a quantity of x-rays) must be as small as possible. The problem is that the quantity of x-rays is dependent on the effective area of an x-ray detecting system (e.g. a collimator and a scintillator) that is arranged downstream of the x-ray source. In other words, the problem is that it is not possible to ensure that a sufficient quantity of x-rays is radiated to the subject if the effective area is small. In general, a plurality of pixels are arranged in a matrix in an x-ray detector, and the x-rays are detected by each pixel. In such an x-ray detector, the pixels are constructed such that the charges that
