Herein, we report the effects of hole transporting polymer (HTP) and diblock copolymer (DBC) thicknesses on the performance of the 3D OLEDs, and investigate their underlying mechanisms. We studied these effects systematically by developing and optimizing the structure of the DBC-based 3D OLED with the gradually varying thicknesses of DBC layers. The OLEDs fabricated by a spin-coating technique exhibited high efficiency, luminous efficiency and current efficiency of 20,000 cd m(-2), 11,000 lm W(-1) and 14,500 cd A(-1), respectively. These results clearly indicate that the current efficiency of the 3D OLEDs with a thin HTP and a thick DBC layer is much higher than that of a 2D OLED. By taking advantage of the advantages of both POLDs and 3D OLEDs, the OLED displays flexible and transparent images with high efficiency and power consumption. This work will provide important guidelines for the fabrication of 3D POLD-based OLEDs and may lead to the development of high-performance and flexible 3D organic electronics in the future.Electrophoretic analysis of human blood from the critical region of Beckwith-Wiedemann syndrome.
