1. Field of the Invention The present invention relates to a technology of a digital broadcasting, and more particularly, to a technology of a digital broadcasting that can provide a service providing interactive functions of the user to the user more convenient, improve the convenience of the user, and increase users' satisfaction. 2. Description of the Related Art A digital broadcasting will be a next generation broadcasting service that does not depend on an existing broadcasting network. A typical broadcast program of the digital broadcasting includes a digital broadcast transmitting program and a digital broadcast receiving program. A digital broadcasting system provides services such as Digital Multimedia Broadcasting (DMB), Digital Video Broadcasting-Handheld (DVB-H), etc., that supports the additional value of the digital broadcasting. An application platform of the digital broadcasting is classified into a real-time streaming protocol (RTP) application platform and a non-real-time streaming protocol (NRTSP) application platform. The RTP/NRTSP is a system that uses an Internet protocol (IP) and controls a real-time stream data and the real-time data is transmitted using a UDP protocol. Since a transmission speed of the UDP protocol is a maximum speed of 1.2 Mbps, the real-time data should be classified into two data streams: a base layer and a subscriber layer. The base layer is a stream that can be transmitted by real-time media protocol (RTP) and the subscriber layer is a stream that can be transmitted by real-time transport protocol (RTP). The RTP/NRTSP includes a plurality of user programs, and the user programs are classified into a program provided by a broadcast provider and a program provided by a user. The broadcast program is a program transmitted by the broadcast provider, and the user program is a program provided by the user. It is assumed that a base station that is an input source of the digital broadcasting transmits a broadcast program to a plurality of base stations. In this case, the broadcast program is transmitted to a subscriber of the base station through a satellite, etc. If the base station that is an output destination of the digital broadcasting transmits a program provided by the user to the base station that is the input source of the digital broadcasting, the subscriber of the base station receives the program provided by the user through a baseband device. Meanwhile, the subscriber of the base station that is the input source of the digital broadcasting transmits a program provided by the user to the
