The new Layer mode in Photoshop CS2 gives you the ability to add alpha transparency in 10.6. Photoshop CS2 also adds the ability to use a channel of light and dark in the Adjustment panel to color correct selections. Photoshop's History panel enables you to easily restore previous versions of your image. Many versions of Photoshop, and many types of computer programs, now offer image-manipulation features that are similar to Photoshop. You can find out more about these features and see their capabilities in the following sections. Photoshop is designed to improve your overall image quality by using specific tools for enhancing your photographs or images. It's not designed to make you a graphics artist, but it can improve your images by eliminating problems or simplifying the appearance of your images. Photoshop's powerful tools are covered in Chapters 7, 8, 9, and 10. Mixing channels of light and dark The powerful Adjustment panel in Photoshop has a new feature called the Channel Mixer that enables you to use a channel of light and dark to correct issues in a selected area or layer of the image. In the new Photoshop Photoshop CS2 menu, in the Adjustments panel, the Channel Mixer is selected by default. Click the red arrow next to the Channel Mixer to open it and see the icon in Figure 1-3. When you have an image open in Photoshop, right-click (Windows) or Control-click (Mac) the Channel Mixer icon and choose Level of Light and Level of Dark from the menu that appears. Photoshop CS2 has the most extensive range of colors and levels that you can adjust in any color selection. **Figure 1-3:** The Channel Mixer icon allows you to use the Adjustment panel to perform detailed corrections. The Channel Mixer enables you to change the amount of light and dark in any selected area of the image. You can adjust Light and Dark by using a slider or by pressing Enter. In this fashion, you can correct problems like areas of over- or underexposure, reduce contrast, create subtle softening in overcast skies, and remove shadows or other problems that may be present in an image. After you apply levels to an image to correct a problem, you can reduce the amount of Light and Dark when you create a new image or move the Adjustment layer to a different area of the photo. Electrical event-related potentials were recorded in a set of 12 subjects during performance of a delayed response task. Subjects were instructed to respond after a double stimulus (S1-S2) paradigm using a 'fist of five' key-press to indicate which of the pair was presented last. The S1 was preceded by the onset of a cue stimulus (S1-CUE) and subjects were instructed to direct attention to it. The task included two levels of cue (high attention and low attention) and two levels of trial type (target absent and target present). Targets were a single stimulus (S2-T) delivered 10 s following the S1-T during the high attention condition. The target stimulus consisted of visually similar but distinct from S1. The amplitude of N2 and P3 in the N2-P3 time window for targets was attenuated by attention at the S2, regardless of the cue's location. Cue location (left or right) did not modulate the target P3 or the differential P3 in the 'high attention' trials. These results suggest that a shift in attention mediated through a shift in the engagement of 'higher' visual areas does not play an important role in modulating interhemispheric interactions. when references to the values go to the dimensions on the top. Clinical neuroimaging in adult medicine: what do we know now, and what have we learned? This review discusses the current status and future of imaging in neurological diagnosis and management, focusing particularly on the recently developed MR modalities for functional (vascular, neural) and molecular (metabolism) imaging, and advances in molecular cell biology and gene therapy. We provide a brief historical overview of the evolution of neurological magnetic resonance imaging (MRI) from its inception in the 1970s to the present, and comment on the present and future role of MRI in neurological practice. MR diffusion-weighted and perfusion imaging are becoming common, owing to their high diagnostic sensitivity and their potential as surrogate markers of tissue injury. These new approaches to MR functional imaging promise to supplement the traditional evaluation of vascular and neural structures and are promising indicators of the state of neural cells and of their response to therapeutic interventions. The current status of functional and molecular neuroimaging is reviewed with regard to conventional as well as 3D-MRI techniques, including those at new field strengths of 7.0 T. Current clinical applications of these new modalities are illustrated, and the future possibilities for pharmacologic or gene therapy are discussed. The use of these techniques is largely evolving and is most likely to impact neurological practice in the near future in the context of cell biology and gene therapy. In this regard, neuroimaging is not only a medical means of diagnosis but also of therapy.Q: Vector of pointers to class I want to make a static vector to hold pointers to objects of a class, like so: static std::vector> fooVector; I would like to be able to add objects of a class, for example: fooVector.emplace_back(new Foo()); Which would add a shared_ptr to a new Foo object to fooVector. I am getting the following errors: error C2248:'std::_Vector_base_hook::_Vector_base_hook' : cannot access private member declared in class 'std::_Vector_base_hook' error C2061: syntax error : identifier '_Rep' and error C2447: '{' : missing function header (old-style formal list?) I've been able to make a similar vector of ints, but I can't figure out why it won't work for pointers to
