Cakewalk

Backed by a subsidiary of Korg, the company responsible for such products as the MPC series and the Pro-One synthesizer, Cakewalk is the latest application to bear the big K symbol. The software's goal is to get you on your feet and get you familiar with the world of music production as soon as possible. Cakewalk's user interface contains a modern layout that helps to quickly recognize the controls and parameters. A menu bar at the top of the screen is responsible for presenting the different kinds of tracks that can be connected. Different categories include sequencers, instruments, effects and more. Within each category, all tracks are listed in a list box in alphabetical order. To get started, simply drag and drop a track from the list box into the track area at the lower part of the screen. Cakewalk offers you plenty of possibilities to customize the track. First of all, the parameters can be dragged from the side and positioned. Then, you can use the controls on the right side of the screen to adjust them. Every track includes its own session monitor that shows the audio level, effects and settings. In addition, a mixer can be used to connect and route any other audio

source. When you want to return to a track, you simply drag it from the track list into the track section. From there, the track becomes available again. To re-route a track, simply drag it out of the track area. Other tabs include a track view window that provides you with a top-down view of the currently selected track and a track inspector that shows the waveform of the currently selected sound. The first tab that you see in Cakewalk is the track editor. Within it, you can access all kinds of parameters such as the audio level, effects, samples and the BPM. In order to save your projects, you simply drag and drop the project from the track list into the project area. Next to the project area, you'll find the track view window. Here, all tracks and MIDI clips are displayed in real time. It is possible to mute and un-mute tracks and perform various editing functions like looping and quantizing. To edit the BPM (beats per minute) value of a track, simply double-click it. In order to access Cakewalk's MIDI features, you'll have to select one of the tracks from the track list. Then, simply plug a MIDI controller into your computer and grab the currently selected MIDI clip. Once you have b7e8fdf5c8
