Email this article To* Please enter your email address* Subject* Comments* The traditional explanation of the economic value of a stay-at-home parent is to assume that he or she earns no money at all, even though this parent is literally responsible for the entire well-being of children. A more sophisticated view, however, is that a parent brings certain skills to bear in raising children. These skills may, in turn, be the greatest asset a child possesses in a low-wage, high-education environment. This paper argues that while a parent does not earn money by engaging in a stay-at-home role, there is an economic value associated with a stay-at-home parent that attaches to his or her presence. Using data on the differences in earnings and educational attainment of mothers versus fathers who reared their children, this paper finds that there is no real wage penalty for being a mother, nor any positive wage premium for being a father. In fact, these data suggest that lower-income, lower-educated women and higher-income, higher-educated men reap more than a dollar for each dollar they invest in raising children. Recommended Stories: Estimates of potential macroeconomic effects are substantial: The paper estimates the potential increase in earnings associated with having a parent at home for each additional hour per week or percentage point above an average parenting time. Results show that (1) at the national level, the potential increase in earnings per hour for women who raise children amounts to around seven dollars, while that for men is around nine dollars, (2) this effect is stronger for lower-income and higher-income individuals, and (3) the effect is not related to the marital status of mothers or fathers. Given the large size of the effect, these calculations provide support for an economic rather than a social explanation of a stay-at-home parent role.Q: Can a sum of products be a sum of squares? I am looking for a reason a number is said to be a sum of squares if it can be written as $a^2 + b^2$ for some numbers a, b . I know that it is a trivial way to check if any number is a square (just check that $x^2 = a^2 + b^2$), but is there

Agent 47; Insurgent.About This activity is designed for use in a school setting. The lesson plan is meant to be used in social studies classes, such as social studies of science or history, or health classes. The activity involves comparing the biological and chemical changes that occur during the action of dissolving sugar into water and during a boil. These changes are then measured in terms of the volume and density of the liquid created. This is a modified version of a lesson plan that was originally created for a school science class. This activity makes use of many of the pre-prepared resources available online for this lesson plan, however, as stated above, the activity is meant to be modified depending on the subject matter of the particular class in which it is being used. There are many variations to this lesson, depending on the particular students' abilities, and the sorts of equipment used for determining changes in volume and density, as well as how the lesson is presented. For example, the lesson could be modified from using a double boiler and a hydrometer to having students use a graduated cylinder and an analytical balance. Alternatively, the activity could be modified to look at changes in fluid density during a flow of water over one end of a piece of shaped glass. This version is meant to be used in a solar physics class. The example below was modified to demonstrate changes in density as a function of temperature. Steps: 1. Prepare a small pot for boiling water. In this example, a double boiler will be used as a substitute for a pot. If a pot is not available, then a
