cognitive science point of view. It is a known approach to cause a shut-down of a motor vehicle, in particular a hybrid motor vehicle, by an operating signal (operating element) having two different states. A first state is an idling state, where the vehicle is preferably idling, and where the target value for an operating variable, in particular a component rotational speed of a drive train, such as the drive train of a motor-generator, is preferably zero, i.e. the operating variable is preferably at a standstill, and this target value is preferably specified as a minimum target value. A second state is, for example, a shutdown state, where the target value is generally higher than the minimum target value. In this case, the operating variable is preferably at least close to a constant value, that is to say a maximum value, in particular zero. The operating signal is, for example, a capacitive or inductive operating element. The operating element is connected to a shut-down control that is operative in a mechanical manner and/or electromechanically. It is also possible for a capacitive or inductive operating element to be connected to a shut-down control that is operative in an electronically

controlled manner and/or mechanically. The operating element is preferably a pushbutton or a switch, a switch or a joystick. It is also possible to use an operating element in which mechanical and/or electronic locking mechanisms are present. Furthermore, there are operating elements which may be operated by a user and which have an actuation parameter in the form of a desired value range, a desired value field or a desired value field range

November 12, 2012 Shop News: The Tomb of Tut-Ankh-Amen View of one of the entrances of the tomb of Tutankhamen. At the turn of the century, Egyptologists were at the pinnacle of their learning, but in 1907, when Howard Carter first stepped foot into the tomb of the Pharaoh Tut-Ankh-Amen, the world lost a great scholar. Deemed a “prince of archaeologists,” Carter emerged as one of the world’s most legendary figures. In the 100 years since his discovery, he’s been featured in countless documentaries, films, and books, and even inspired an entire genre of cheap knock-offs and caricatures. But it’s hard to remember Carter without taking into account the era of which he was a part. As archaeologists were discovering many of the world’s greatest archeological sites, science was far from a world-changing force. As a

result, the archaeology taught in the classrooms of the world was thought to be little more than a museum attraction, confined to an out-of-date approach to conservation. Carter's story is a great example of how an individual, working outside the traditional mold, produced incredible results. In this modern era of consumerism, it's easy to forget that a great deal of information was still unknown in Carter's time, and that just because archeology was fashionable, didn't mean it wasn't hard work.
