But when I tried ALTER TABLE Tbl ADD INDEX Idx (contact) It gives an error like this: The key for the index 'Idx' is invalid. The index being added has the key constraints 'Idx' (column name 'contact') and 'Idx' (column name 'f_idx')(foreign key to parent table 'Tbl'(PK)). Also, I ran some SELECT queries, and the contact field does not appear in the Indexes. What is going on here? Also, I can modify the contact index, is it going to change anything? A: You have a foreign key constraint. That means that the columns in the primary key can't be the same as the columns in the foreign key. So you can't include them all in a single index. Try using them separately. See here for more details: SQL Server foreign key: the Primary keys/foreign keys are added to the "Index" column in the INDEX clause, while the Index Key columns are added in the "Key" column A: I think you have understood the error you are receiving: The key for the index 'Idx' is invalid. The index being added has the key constraints 'Idx' (column name 'contact') and 'Idx' (column name 'f_idx')(foreign key to parent table 'Tbl'(PK)). According to the
