Elden Ring X64 [Updated]

Field This disclosure relates generally to computing systems, and more specifically, to a memory compression format for register-based multi-channel processing. Related Art Certain systems are configured to operate with data stored as a multi-dimensional array of bytes. For example, certain Central Processing Unit (CPU) architectures provide instruction sets that operate with memory and/or register data in multi-dimensional arrays of bytes. These systems also use a format in which memory operands in the arrays are stored in a format that can be compressed, such as, for example, a packed byte format. In the context of a multi-channel processing system, the compressed byte format is used for storing the operands of instructions that operate on different channel components. For example, some systems use a packed byte format for storing data operands that are used to operate on separate register channels. When a multi-channel processing system is operating with memory operands, many of the bytes of the operands are empty. For example, when encoding a multi-channel operand value using a packed byte format, empty bytes are ignored, and

therefore they can be used to compress the format. However, many systems that are operable using a multi-dimensional array of bytes are configured such that the system is able to process operands in a format that is not compressed. In these systems, the non-compressed data is stored as consecutive bytes. For example, when an instruction is used that is operable using a packed byte format, the system is able to reconstruct the original operand by writing the bytes of a reconstructed packed byte operand that is written to the multi-dimensional array of bytes. However, when the multi-dimensional array of bytes is encoded as a non-compressed array, only some of the bytes are empty, and most of the bytes are non-empty. Therefore, the system is unable to reconstruct the original operand when the multi-dimensional array of bytes is encoded as a non-compressed array. Hence, it would be desirable and useful to provide a method for recovering operands in a format that is compressed but that is not stored as a packed byte format.
