NucType provides you with a built-in function that allows you to measure and compare chromosomes or karyotypes. The user interface is intuitive and easy to use, as it only takes a few seconds to open, load and compare images. It is mostly designed for biologists, but it can easily be used by students who are learning this profession. What's New in Version 1.04 Version 1.04 is a free update to the previous version. This version includes bug fixes. Enhancements: Fix crash on specific picture or NUC file Ratings NucType is a great application for measuring and comparing chromosomes or karyotypes. It works fine, but it has lots of flaws, including slow response and the lack of an English version. Overall, it's a great tool, but it's not without its flaws. 1.0 Apr 7, 2018 NucType provides you with a built-in function that allows you to measure and compare chromosomes or karyotypes. NucType is an application that allows you to compare karyotypes on your images. It works with cytogenetic images made by using computer microscopes and it allows you to look for karyotypic abnormalities. There are some features like sorting that can be improved since it's still in beta and there's no English version but it's still simple to use. ]]> Get index of selected item in ListView using MVVM How to achieve index of selected item in ListView using MVVM I have ListView which is binded to collection of objects: and I want to know which item was selected on condition if(selectedItem!= null) { int indexOfSelected = Items.IndexOf(selectedItem); //but how? } Is there any another way? Thanks for response. A: I suggest you to use the SelectedItemChanged event. If you just have one ListView it will be enough : public ObservableCollection Items { get { return \_items; } set { \_items = value; } } public YourModel SelectedItem { get { b7e8fdf5c8

Chromosome length: if you are using NucType for a biological study then Chromosome length is the first thing that should be of interest. Chromosome length is the total length of the complete chromosome plus the centromere, the telomere and the two centromeres of each of the arm pairs (A and B). You can calculate the length of each chromosome arm from the number of MCN of the arm. The Acrocentric chromosome has one centromere and arm portion. Thus the chromosome length is  $2 \times \text{MCN}$ . The chromosome is labeled in NucType with the appropriate color like: orange for the G group and so on. So for example, the length of chromosome 5 is 17m. The number is in red font color. Measurements: The number of satellites also known as p-arms is added to the total length of the chromosome. There are 3 different types of satellite. 1- the first type consists of black dots called Macrochromosome Satellite (MCN). 2- the second type is the intercalary satellite (ICN). 3- the third type is the pericentromeric satellite (PCN). The name of each satellite type is indicated in red font color. The more p-arms, the bigger the chromosome is and the irregularity of the chromosome is. If you have multiple chromosomes of the same size then the chromosome is still a normal karyotype with multiple chromosomes of different sizes (highly polymorphic karyotype). Grouping: Grouping is very important when you are studying the chromosome (hairpin) structure of different cell types. So, by grouping you are classifying the chromosomes by their size. There are more than 12 possible groupings. NucType Comments: Concerning Windows: NucType is a 32 bit application. So if you have a 64 bit operating system, you need to uninstall the old copy of the application and then install the new one. Concerning Mac OS X: NucType is a 32 bit application. So if you have a 64 bit operating system, you need to uninstall the old copy of the application and then install the new one. Concerning Linux: NucType is a 32 bit application. So if you have a 64 bit operating system, you need to uninstall the old copy of the application and then install the new one.  $\{\mathrm{cm}\}^{\{-3\}}$  where  $n_{\setminus}$

## What's New in the NucType?

Computes karyotype length, cross-size, arm-size and intercalary-satellite. For specific chromosomes: (1) The "satellite size" and "intercalary-satellite" size is displayed. (2) You get detailed information on the length of specific chromosomes. (3) You get the average length of the chromosome. (4) You can add or remove a specific chromosome to this project and analyze it. (5) You can drag and drop a file to the NUC image for analysis. (6) You can select a specific area within the karyotype and get more information. (7) You can make a selection from the image to open it in the image editor. (8) You can adjust the size of the image itself. (9) There is a "Metric Mode" window, that allows you to set the units that are used to measure. For a group of chromosomes: (1) You can sort all chromosomes by the "satellite length". (2) You can get detailed information on the length of multiple chromosomes. (3) You get the average length of the chromosome. (4) You can add or remove a specific group of chromosomes. (5) You can't drag and drop a file to a group of chromosomes. (6) You can select a specific area within the karyotype and get more information. (7) You can adjust the size of the image itself. (8) There is a "Metric Mode" window, that allows you to set the units that are used to measure. (10) You can add a chromosome to the project. (opens image editor) (11) You can make a selection from the image to open it in the image editor. (12) The project can be saved and you can load it again.
