To compare the effectiveness of acetazolamide and glipizide as adjunctive therapy in hyperglycemic hyperosmolar state. Randomized, prospective trial. Two intensive care units. Thirty-eight patients were enrolled. Acetazolamide was given as 250-ml bolus injection followed by 250-ml infusion at a rate of 2-3 ml/kg/h. Glipizide was given as an initial dose of 1.5 mg/kg followed by increments of 0.5 mg/kg until the desired dose was reached. Insulin and fluid therapy were titrated to maintain euglycemia. Blood glucose, serum electrolytes, blood urea nitrogen (BUN), and creatinine were measured at the time of the admission and after 48 h of therapy. The percentage changes of sodium, potassium, and calcium were determined to evaluate sodium-to-potassium and calcium-to-magnesium ratios. Serum glucose levels were significantly reduced after 24 h of treatment by both acetazolamide (1,746 +/- 617 to 796 +/- 172 mg/dl, p 6d1f23a050
