alerting systems track systems to identify issues and events. notifications are sent to slack, email, pagerduty, and syslog channels and can be triggered when something happens, such as a reboot, or if a specific metric reaches or drops below a threshold. this functionality is supported by netq, netflow v9, and recent netflow v9 versions. in this section you can find out about utm. it can be used to receive and forward traffic, to help with firewall management, and to help control your internet traffic. utm is available as a plugin for netq, netflow v9, and a recent netflow v9 version. installation is on utm downloads page. the latest stable release of the wireshark package is available from the wireshark downloads page. this version introduces a new snapshot configuration feature for recording traffic on tls 1.3-enabled servers. see the snapshot chapter in the documentation for more details. if a network or

device is operating abnormally, it will be reported by a netq events channel. for example, if the power supply to a nic or a switch is malfunctioning, then it will trigger an event. typically, netq will broadcast this event to several slack, pagerduty, syslog, and email channels. it can also be reported to an external monitoring service such as nagios. this page shows how to configure authentication using plug-in authentication with the key management service (kms). if you are not sure which authentication plugin to pick, choose basic authentication. this page shows how to configure plug-in authentication to use the kms api to authenticate users. we recommend that you use basic authentication instead of user authentication unless you need to use the user authentication plug-in to authenticate a user.

In case anyone is interested, all the MD projects that made up the workshops mentioned in this page are listed here. You can go to the projects you are interested in and see available cases. Of course, if you have your own projects, they are welcome! Upgrading to the 4.1.x series of Wireshark is a simple and safe process. Wireshark provides a UI to upgrade itself to the new version. Although I don't recommend it, it is possible to reinstall Wireshark as well. The process can be performed in place. The previous version of Wireshark should be removed with a program such as "Degradate" or "uninstaller". Uninstallation of the previous version is not recommended because it is necessary to clear the entries present in Wireshark configuration files. When installing the new version, we recommend using the most recent available version of gcc. If the platform is using a prebuilt compiler then the newest version may be installed without recompiling Wireshark.

Wireshark by default stores the architecture, distribution, and compiler in configuration files. These can be found in `WS_ARCH_BUILD`, `WS_ARCH_DISP_ARCH`, and `WS_COMP_TYPE`. If desired, these files can be reset to their defaults using the command `./configure --force`. The Windows package of Wireshark can be installed using the Wireshark installer. The Wireshark installer can be downloaded from the

Wireshark home page or the download page. Some have asked me to document the new features. We will document these at a later time. You can download an HTML release notes from the Wireshark home page. We will provide versions of all manuals in HTML, as they are released. 5ec8ef588b
