images can be added to a revu project from a variety of sources, including 3d warehouse assets, autocad drawings, or even a local drive or folder. a small set of primary image types are available, but the application will automatically detect and use most image types (jpeg, png, gif, bmp, tiff, psd, etc.). every revu image has a fully editable metadata record, and image details can be added for any part of the model. for example, you can define how the image relates to the model's scale, and set the scale and offset of any image views. revu has been updated with a set of new features designed to make building bim models as easy as possible. simply drag and drop to construct models and sections, change scale and rotation, or duplicate and connect two or more models for a common parent. instant collision detection ensures models can be assembled without a single hole in your model. customize your model's layer system and assign different attributes to different parts of the model. adding or changing parameters to a pdf

stream is as simple as dragging and dropping them into the relevant fields. the stream can also be compressed in the process, saving time and disk space. as you add parameters, the application will warn you when you have exceeded a limit for the stream, and will let you know if the problem is the stream itself. an option to add double-sided annotation to existing pdf files is included. this is a great way to annotate a printout, or to mark a section of the model in a revu project with annotations from your autocad drawings. revu's report generation functionality has been enhanced to help you generate and prepare reports in a more streamlined fashion. the ability to generate pdf reports is native to revu, and you can choose to merge in any number of external reports. links can be automatically created to drive sales quotes, presentations or other documents, as well as generate more complex reports with custom formats.
