The pdf documentation is in the same directory as the crc or magn function, or it can be printed from the menu. Also note that a few extra functions that are not in the documentation but work in the V8 interface are implemented in the runcode.cpp source file. Hi guys, I am also trying to reproduce the results in the ISOPE paper: Investigation of Response Amplitude Operators for Floating Offshore Wind Turbines. But I encountered a problem with the FAST running. Could anyone help me out I am using the OC3-Hywind model coming with the FAST V8. I added the extra damping and stiffness as suggested in the OC3 definition pdf file. Since my OS is win7 64 bit, I released the 64bit OC3 controller.dll file using Visual Studio. The download is an MSI file that you can use to install the Readiness Toolkit on a user's computer. After it's installed, when you run the Readiness Report Creator, a UI wizard steps you through the process of creating a readiness report. There is also a standalone executable that can be run from the command line or used with scripts. This is useful if you need to collect readiness information from users throughout your enterprise in a more automated manner. For more information, see Getting readiness information for multiple users in an enterprise. 5ec8ef588b
