Unlike Photoshop Elements 2, Photoshop CS wasn't well suited to small-scale art-style editing. Now, there are **new editing controls** for nibbling around with in smaller, more precise areas. The now-visible retouching mask, which you select to mark the area of a photo you wish to edit, can be brought into focus with a pinch to zoom or you can **turn on grid lines**. Adobe's effortless export options—choose between a variety of common file types—are a novel idea, but also an unwelcome one. The idea behind this feature is great: it makes it easier to move files between the Mac and your smartphone or tablet, and it lets you choose what is best for your workflow. What's wrong with this, though? One, the default selection is the first, largest, exported image, with the same overall size. This contains no thumbnail or metadata. Two, choosing "Original size" as the file format limits you to 300 dpi. This is optimistic, given those of us who have digital cameras who use them to shoot RAW files. And three, you cannot choose the kind of export, or adjust the size or dpi. As we've already seen, changing these values will skew the export. And, since you're getting a free copy of the original image when you save it in this way, why not let Photoshop's best guesses work themselves out? Why not let us control what we get with as little hassle and as much metadata and effort as possible? Why not allow us to simply pick from a list of common image size/dpi combinations? This is not a bug, but a fundamental design flaw. Regardless, I can assure you the option to choose the export file type is on the Mac App Store version.
