As the creator of Photoshop for the 20 years and Photoshop Lightroom for the next 10 years, it is always my pleasure to work with the product. However, I could not use Photoshop and Lightroom for longer than a few weeks at a time when testing a new version, and came to the conclusion that it somehow seems to me a bit cumbersome. In most of the software's key tools I was confused with lots of options and could not figure out how to use them properly. And this is despite the fact that I know the general principles of these tools. This is not just an impression of someone who did not get Photoshop in its right format. I also found it hard to understand how it is possible to apply all of the complex features of the software since the current version is not extremely easy to use. In fact, you can always search for a support request on Adobe's website, and the majority of the problems exactly point to critical basic functions that seem to be

inexistent. For example, I can not find a way to apply certain adjustments to a selected group of layers. What we need here is the "Drop tool".

High-resolution images aren't just for web pages or brochures—they're also extremely helpful when creating print media. Print manufacturers tend to use smaller sizes than web-based resolution displays, which means that you'll need to take a photo of your project at a high resolution before it's too late to make the change. If you're working exclusively with a desktop scanner, make sure that you scan your images at a standard 1200 dpi setting, and don't choose a higher resolution (3800 dpi) unless you're scanning a very large quantity of images (500+). Scanning will be the most expensive step in the process, so you'll want to make sure that you simply don't have enough memory to scan all images of a particular project at a higher quality resolution. Pixel density is actually a lot more important when working with inkjet printers than laserjet, but to cut to the chase, 600-Dpi is the standard for desktop inkjets. For desktop laser printers, the resolution is a lot less important. If you have a professional photo printer that doesn't have either a 600- or 1200-dpi setting (one of the most popular brands, Canon, doesn't have one), you shouldn't worry about it—unless you're printing very large quantities of images. In rare cases, if you're printing for the newspaper and they ask for 75 DPI (and that's why they're asking for it), then you'll have to go that high. If you'll be printing large quantities of the same image, you might want to consider printing the images as a set at 300 dpi. That's the standard for inkjet printing—higher resolutions need more data, and the more data you have, the smaller the size of the image. That's a good reason to scan your images at very high resolution, but remember that it increases the cost of scanning. If you're printing a lot, but you're not using a photo blowup service, you can always print smaller images later. If you're getting your images printed at a physical retail location, such as a photo shop, then the size of the image might be part of the conversation. If you're printing your images in large quantities, you might want to save the cost of a single color 4×6 of your print by printing 4 or more of them at 300 dpi.
