There are also a lot of other additions, such as the ability to apply a custom preset to adjust the exposure, white balance, sharpness and a few others. Recently, the reverse function, where images can be created from Lightroom camera RAW image files, is also available. The application is all that I need to create the images I need. Why do I need more? Mostly because there's still some room for improvement. This is where the product manager has a lot of room for improvement. By that I mean that sometimes it tries to be too smart. In the first case, this is the tool where the upgrade could have been a bit more fluid and intuitive, but it's still usable. The second case is a photo modifier. That is, available tools do not match the features they should. Take the "Preset" tool. The modification of font and text is still quite well, but graphics and brushes didn't go that far. Also, the modifications that are made are fixed after applying the preset; further changes do not carry over. This could have been done with little effort. Photo editing software often takes a person's delicate and

precious photos and strips them down to their basic raw form. Such is the case with Adobe Photoshop. However, if a person feels the need to give their photos a certain look, they should take the time and invest some money in Adobe Photoshop. iStock Photo / Michaela Cline The last question I will try to answer is about the future of Photoshop. This trusty tool is going through major changes and a lot of them are already implemented in the next Lightroom. So consider them pre-Beta features.

Photoshop Elements may or may not have features for:

- Adobe knew of the features on the list and their existence in the Photoshop and Photoshop Elements SDK.
- The Features Advisor is our best guess at whether that feature exists
- The feature does not exist! Most features will continue to show up here as “available” in CS5 or later, but might not work in older versions of Photoshop Elements, even if the feature exists in the SDK.

Many of the image and vector editing features of Photoshop will be largely incompatible with the photo editing features of Photoshop Elements, however, key Photoshop features in use by other Adobe industry tools (and used by many photographers) such as Lumen, in-camera tools and various post-processing products will continue to be supported. Make sure to check the function of these tools against other Adobe software tools as you plan your career with Photoshop Elements. The Feature Advisor tool is a “best guess” at whether a feature exists. Some features include: the ability for a camera to communicate with Photoshop Elements and download images that are edited in Photoshop Elements; Image Browser to view image files and be able to convert a RAW file to JPEG format; in-camera RAW conversion for post-processing RAW images in-camera; and Print Processing, to create a print-ready file from a file that has been previously created and saved in Photoshop Elements. A supported web cam configuration stream and HDSDI file exchange have been successful features to date. More information about the Photoshop and Elements SDK can be found in the Photoshop SDK Readme . There is a table of links to SDK documentation on the Photoshop Elements SDK Documentation .
